Quantum Theory of Gravity

- respects the principles of GR and QM
- same predictions as QFT at low energies
- reproduces GR at cosmological scales
- difficulty: quantum gravity only appears at very high energies

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Attempts so far

- "like an attempt to breathe in empty space" (Einstein)
- e.g. Loop Quantum Gravity, string theory
- procedure: start with a classical theory and impose the laws of QM!

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Starting from Quantum

Idea: the world is quantum mechanical from the get go

- no need to start from a classical theory
- instead:
 - take a quantum system (Hamiltonian + wave function)
 - find the emergent classical world inside

- existence of particles not assumed
- existence of spacetime itself not assumed!

Aim: find the structure of spacetime encoded in the wave function

1. divide Hilbert-space into "pieces" (\sim particles)

$$\mathcal{H} = \mathop{\otimes}\limits_{i} \mathcal{H}_{i}$$
 \downarrow
 $|\Psi\rangle = \sum \mathop{\otimes}\limits_{i} |\Psi_{i}\rangle = \sum |\Psi_{1}\rangle |\Psi_{2}\rangle |\Psi_{3}\rangle |\Psi_{4}\rangle ...$

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ● □ ● ● ●

2. entropy (\sim information content of the state):

$$S(A) = -\operatorname{Tr}\{\rho_A \log \rho_A\}$$

3. mutual information between "pieces":

$$I(A:B) = S(A) + S(B) - S(AB)$$

- 4. Define a graph
 - nodes: pieces
 - edge weights: mutual information

・ロト・西ト・山田・山田・山口・

5. Redundancy-constrained states:

$$S(R) \propto \sum_{a \in R, b \in \bar{R}} I(a:b)$$

Idea: pieces closer together should have more mutual information

6. Distance from mutual information:

$$d_{AB} = \ell_0 \cdot \Phi(\frac{I(A:B)}{I_0})$$

Spatial metric!

Recover the dimension:

- 1. consider an r-ball centered around some point p
- 2. calculate its total entropy
- 3. get the dimension from the scaling:

$$S(r,p) \sim r^{D_f}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

4. $D = D_f + 1$

Recovering a smooth geometry is also possible:

- Multidimensional scaling
- Regge calculus

Examples

Figure: Ground state of 1D antiferromagnetic Heisenberg spin chain

Curvature

Local entropy perturbation: curvature at the point

 $\mathcal{R}_{p} \propto -\delta S_{p}$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

Curvature

Nonlocal entropy perturbation: wormhole-like structure

 ${\cal R}_p \propto -F_\lambda'(p,p')\delta S_p$

always positive!

Einstein's equation

$$G_{\mu
u} = C \cdot T_{\mu
u}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Einstein's equation

- modular Hamiltonian: $K = -\log \rho$
- Entanglement first law:

$$\delta S = \delta \langle K \rangle$$

- modular energy density: $\epsilon_{p} = -\delta \langle K \rangle$
- CFT: connection to stress-energy tensor:

$$\epsilon_p^{CFT} = C \cdot \delta \langle T_{00}^{CFT} \rangle$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

Einstein's equation

assume framework adapted for time evolution

If no external curvature:

$$\mathcal{R}_p = 2G_{00}(p)$$
 \downarrow
 $G_{00} = C \cdot \delta \langle T_{00}^{CFT} \rangle$

Apply same reasoning for all spatial slices:

$$G_{\mu\nu} = C \cdot \delta \langle T_{\mu\nu}^{CFT} \rangle$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

Einstein's equation holds for local perturbations of a smooth manifold

Future research directions

Time evolution

Emergent Lorentz invariance
