# Fool CNN

$x$   
"panda"  
57.7% confidence

$+ .007 \times$

$\text{sign}(\nabla_x J(\theta, x, y))$   
"nematode"  
8.2% confidence

$=$

$x + \epsilon \text{sign}(\nabla_x J(\theta, x, y))$   
"gibbon"  
99.3 % confidence

- ▶ CNN works on gradients
- ▶ Magnify gradient by short ranged small changes
- ▶ Add your noise to the image, the difference will always be less than 1% so invisible by eye (in most cases)

# Why do we need data augmentation? Example: VGG16

Layer (type)	Output Shape	Param #
conv2d_1 (Conv2D)	(None, 224, 224, 64)	1792
conv2d_2 (Conv2D)	(None, 224, 224, 64)	36928
max_pooling2d_1 (MaxPooling2D)	(None, 112, 112, 64)	0
conv2d_3 (Conv2D)	(None, 112, 112, 128)	73856
conv2d_4 (Conv2D)	(None, 112, 112, 128)	147584

- ▶ We have millions of weights especially for large images
- ▶ Generally we have few thousand images at most

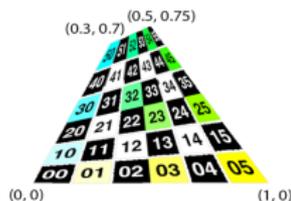

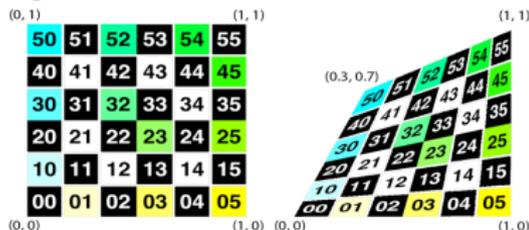

# Data augmentation

- ▶ Add noise
- ▶ Do convolution (enhance, blur)
- ▶ Geometric transformation
  - ▶ rotation (most neural networks do not recognize upside down objects)
  - ▶ distortion (viewed from angle, etc.)
  - ▶ partial image (most often part of the object is hidden in the image)

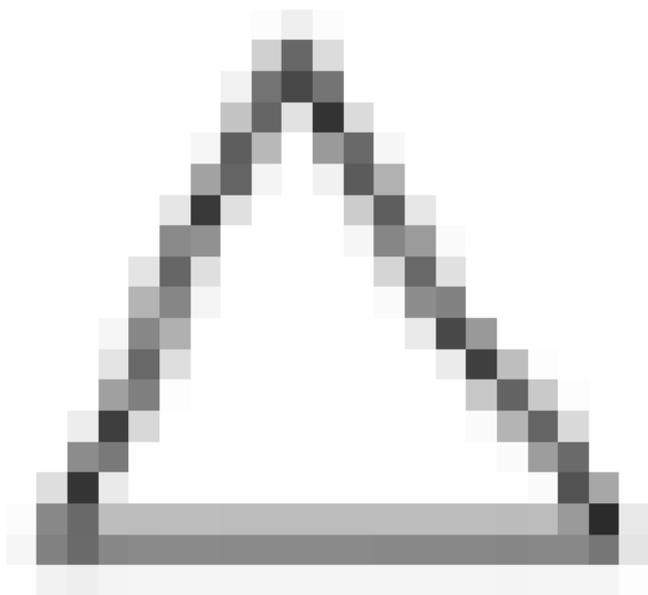

# Data augmentation

- ▶ rotation (most neural networks do not recognize upside down objects)
- ▶ distortion (viewed from angle, etc.)
- ▶ partial image (most often part of the object is hidden in the image)

<https://people.dmi.uns.ac.rs/~marko.savic/teaching/rg1/resources/transformations.pdf>

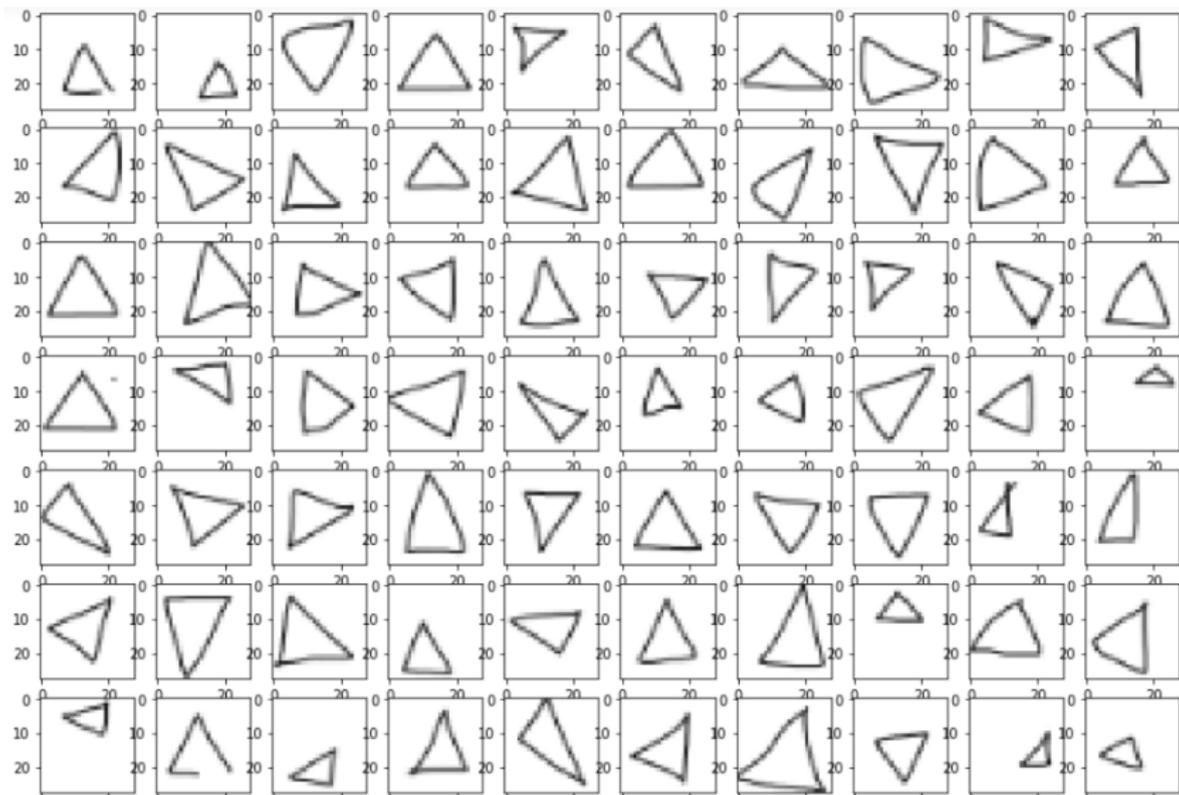

## Example

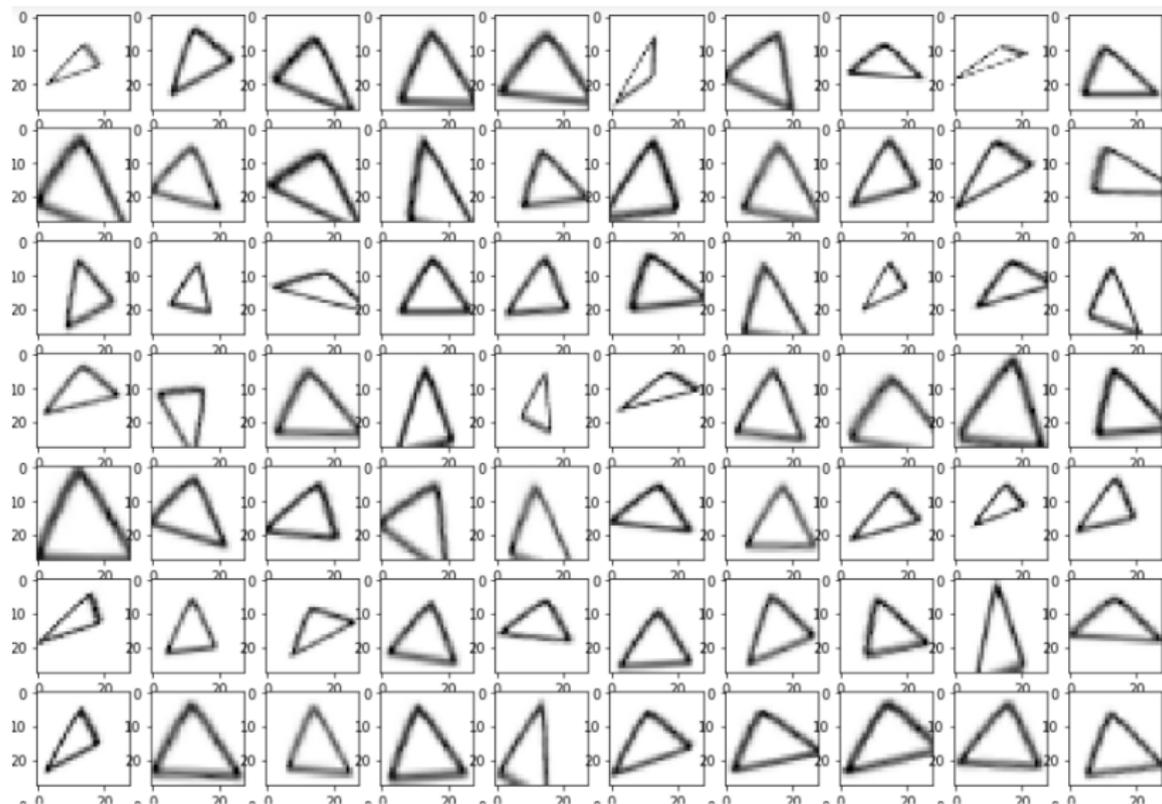

► One of the triangle from our shapes set

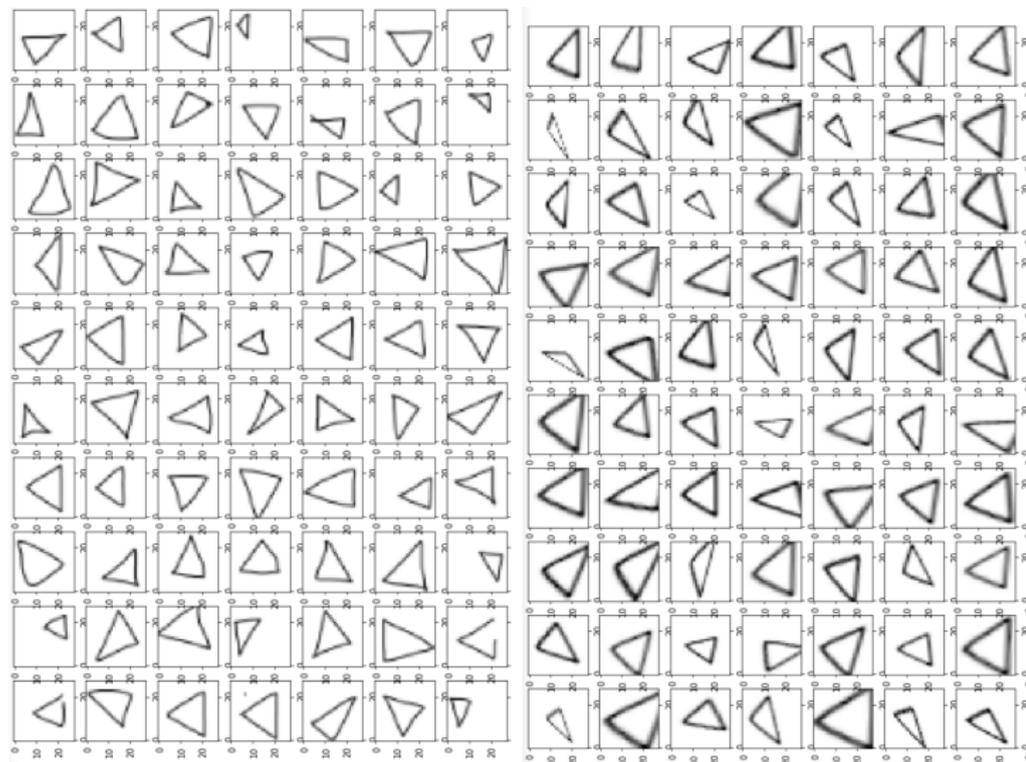

# Original set

## Augmented set from the fourth

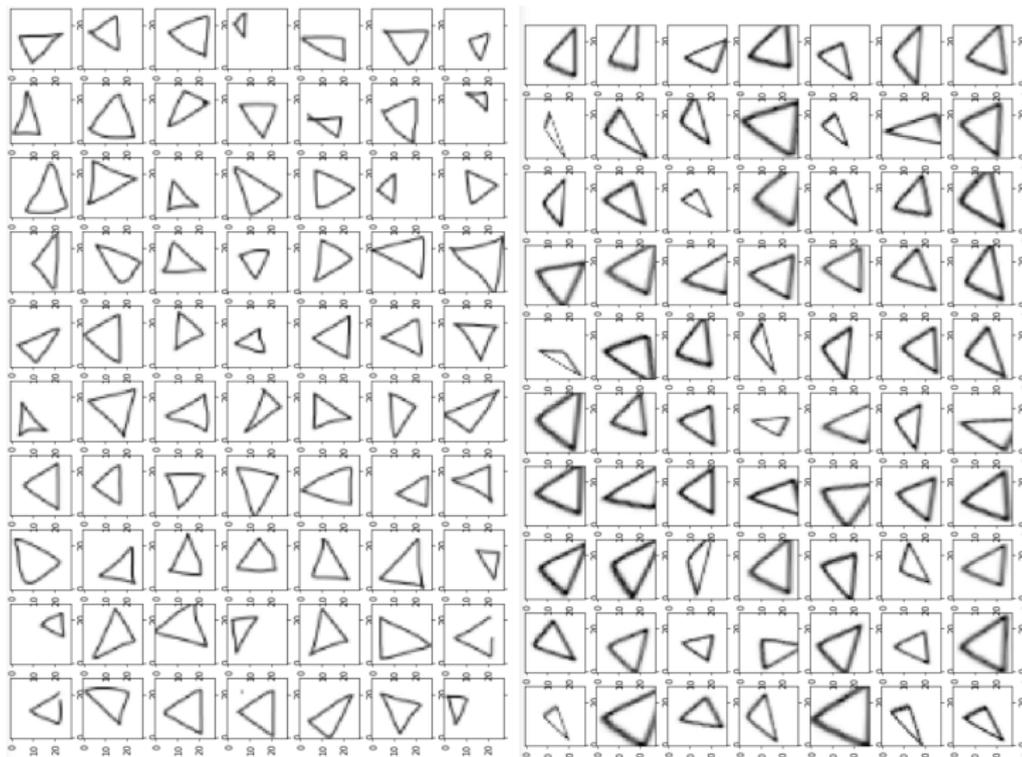

# Original set and augmented

# Original set and augmented

- ▶ Shapes are ok, but contrast and width is definitely off

# What kind of transformations?

- ▶ What you think may come for!
